

## MA3 Features

- Miniature size (0.48 in. diameter)
- Non-contacting magnetic single chip sensing technology
- -40C to 125C operating temperature range
- 10-bit Analog output - 2.6 kHz sampling rate
- 10-bit PWM output - 1,024 positions per revolution, 1 kHz
- 12-bit PWM output - 4,096 positions per revolution, 250 Hz

## MA3 Product Description

The MA3 is a miniature rotary absolute shaft encoder that reports the shaft position over 360° with no stops or gaps. The MA3 is available with an analog or a pulse width modulated (PWM) digital output.

Analog output provides an analog voltage that is proportional to the absolute shaft position. Analog output is only available in 10-bit resolution.

PWM output provides a pulse duty cycle that is proportional to the absolute shaft position. PWM output is available in 10-bit and 12-bit resolutions. While the accuracy is the same for both encoders, the 12-bit version provides higher resolution.

Three shaft torque versions are available: high torque (-D option), low torque (-N) and ball-bearing (-B). The high and low torque versions have a stainless steel shaft and brass bushing lubricated with grease to provide ideal torque for panel mount, human-interface applications. The ball-bearing version has a brass shaft and miniature precision ball bearings suitable for high speed and ultra low torque applications. The ball-bearing version is only available with a 1/8" shaft diameter.

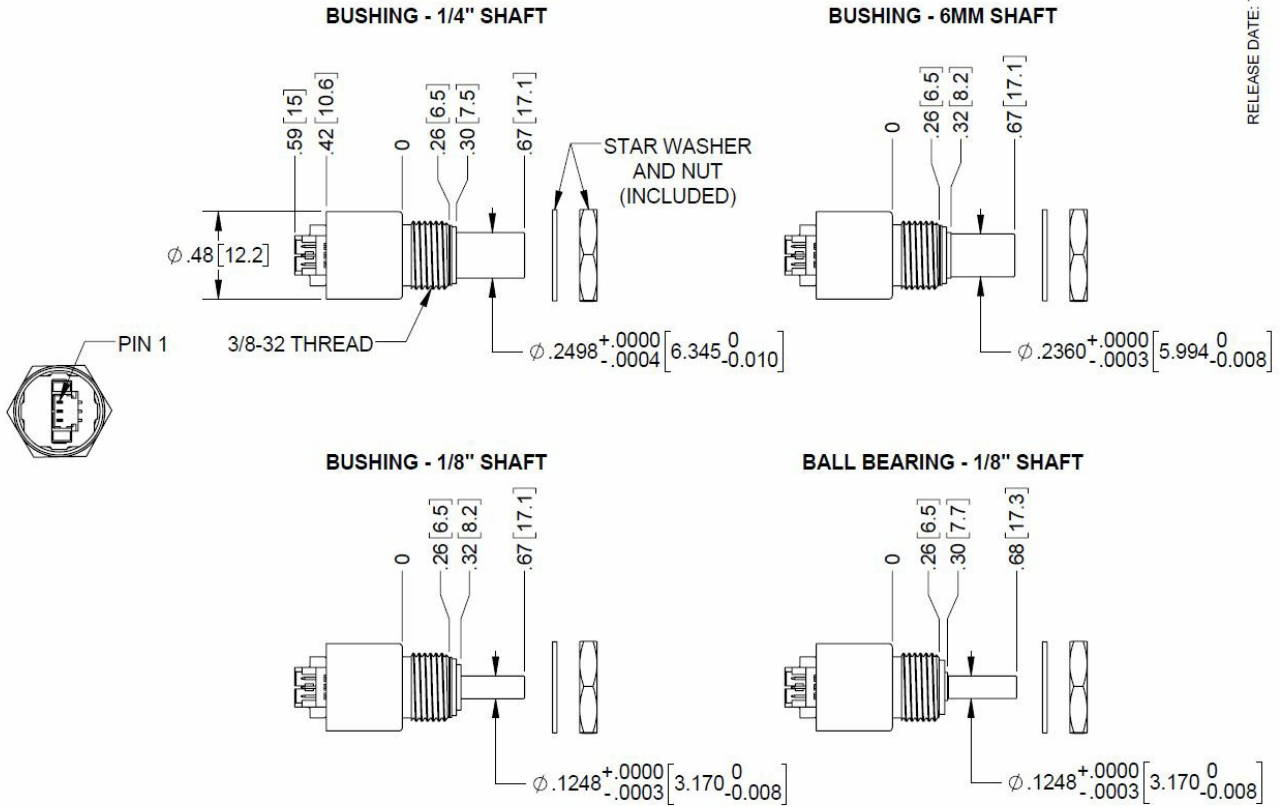

Connecting to the MA3 is simple. The 3-pin high retention snap-in 1.25mm pitch polarized connector provides for +5V, output, and ground.

(1) The chip that decodes position uses sampled data. There will be fewer readings per revolution as the speed increases. The formula for number of readings per revolution is given by:

### 10-bit PWM:

$$n = 625200 / \text{rpm}$$

### 12-bit PWM / Analog:

$$n = 156600 / \text{rpm}$$

(2) only valid with negligible axial shaft loading

## MAGNETIC FIELD CROSSTALK

The **MA3** absolute encoder contains a small internal magnet, mounted on the end of the shaft that generates a weak magnetic field extending outside the housing of each encoder. If two MA3 units are to be installed closer than 1 inch apart (measured between the center of both shafts), a magnetic shield, such as a small steel plate should be installed in between to prevent one encoder from causing small changes in reported position through magnetic field cross-talk.

## ELECTRICAL

PARAMETER	MIN.	TYP.	MAX.	UNITS
Power Supply	4.5	5.0	5.5	Volts
Supply Current	-	16	20	mA
Power-up Time	-	-	50	mS

## ANALOG OUTPUT OPERATION

Analog output is only available in 10-bit resolution. The analog output voltage is ratiometric to the power supply voltage and will typically swing within 15 millivolts of the power supply rails with no output load. This non-linearity near the rails increases with increasing output loads. For this reason, the output load impedance should be  $\geq 4.7k\Omega$  and less than 100pF. The graphs below show the typical output levels for various output loads when powered by a 5V supply.

PARAMETER	MIN.	TYP.	MAX.	UNITS
Position Sampling Rate	2.35	2.61	2.87	kHz
Propagation Delay	-	-	384	$\mu$ S
Analog Output Voltage Maximum (1)	-	4.987	-	Volts
Analog Output Voltage Minimum (1)	-	0.015	-	Volts
Output Short Circuit Sink Current (2)	-	32	50	mA
Output Short Circuit Source Current (2)	-	36	66	mA
Output Noise (2)	160	220	490	$\mu$ Vrms
Output Transition Noise (3)	-	0.03	-	Deg. RMS

(1) With no output load. See graphs below.

- (2) Continuous short to +5V or ground will not damage the MA3.
- (3) Transition noise is the jitter in the transition between two adjacent position steps.

### PWM OUTPUT OPERATION

The magnetic sensor chip in the MA3 has an on-chip RC oscillator which is factory trimmed to 5% accuracy at room temperature (10% over full temperature range). This tolerance influences the sampling rate and pulse period of the PWM output. If only the PWM pulse width  $t_{on}$  and the nominal pulse period is used to measure the angle, the resulting value also has this timing tolerance. However, this tolerance can be cancelled by measuring both  $t_{on}$  and  $t_{off}$  and calculating the angle from the duty cycle.

# MA3 MINIATURE ABSOLUTE MAGNETIC SHAFT ENCODER

PARAMETER	MIN.	TYP.	MAX.	UNITS
PWM Frequency (-40C to 125C)

Output Low Voltage (V <sub>OL</sub> : @4mA Sink) (2)	-	-	0.4	V

(1) Transition noise is the jitter in the transition between two adjacent position steps.

(2) Continuous short to +5V or ground will not damage the MA3.

### 10-bit PWM:

$$x = ((t_{on} * 1026) / (t_{on} + t_{off})) - 1$$

If  $x \leq 1022$ , then Position =  $x$

If  $x = 1024$ , then Position = 1023

### 12-bit PWM:

$$x = ((t_{on} * 4098) / (t_{on} + t_{off})) - 1$$

If  $x \leq 4094$ , then Position =  $x$

If  $x = 4096$ , then Position = 4095
